

# Package ‘psychtoolbox’

January 29, 2022

**Title** Tools for psychology and psychometrics

**Version** 0.0.0.9000

**Description** This package contains functions helping to analyse psychological data.

**License** CC BY 4.0

**URL** <https://gitlab.com/lukas.novak/psychtoolbox>

**Encoding** UTF-8

**LazyData** true

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.1.2

**Imports** coin,  
docextractr,  
dplyr,  
foreign,  
magrittr,  
rmarkdown,  
rstatix,  
stats,  
tidyr

**Suggests** testthat (>= 3.0.0)

**Config/testthat/edition** 3

---

clin_sig_chang	<i>Clinically significant change</i>
----------------	--------------------------------------

---

### Description

This easy function calculates Clinically significant change (clinical cut-off scores) as defined by Jacobson and Truax (1991).

### Usage

```
clin_sig_chang(SD_0, SD_1, M_1, M_0)
```

### Arguments

SD_0	standard deviation of the non-clinical population
SD_1	standard deviation of the clinical population
M_1	mean of the clinical population
M_0	mean of the non-clinical population

### Format

numeric vector of values

### Details

This function computes cut-off score differentiating between the clinical and non-clinical population based on the Jacobson and Truax (1991) formula (p. 13). The mathematical formula can be also found in Biescad & Timulak(2014), p. 150.

### Value

numeric vector

### Author(s)

Lukas Novak, <lukasjirinovak@gmail.com>

### References

Jacobson, N. S., & Truax, P. (1991). Clinical significance: A statistical approach to defining meaningful change in psychotherapy research. *Journal of Consulting and Clinical Psychology*, 59(1), 12-19, DOI: <https://doi.org/10.1037/0022-006X.59.1.12>

[RCI\(\)](#) function for calculation of the Reliable Change Index

**Examples**

```
clin.cut.off=clin_sig_chang(SD_0 = 3.5,  
                           SD_1 = 2.1,  
                           M_0 = 4.2,  
                           M_1 = 12.1)  
  
clin.cut.off
```

---

dat	<i>DATASET_TITLE</i>
-----	----------------------

---

**Description**

DATASET\_DESCRIPTION

**Usage**

dat

**Format**

A data frame with 835 rows and 2 variables:

Gender integer COLUMN\_DESCRIPTION

IRI\_EC double COLUMN\_DESCRIPTION

**Details**

DETAILS

---

RCI	<i>Reliable Change Index (RCI)</i>
-----	------------------------------------

---

**Description**

This function calculates Reliable Change Index (RCI) as modified by Wiger and Solberg (2001, p.148).

**Usage**

```
RCI(SD_0, test.ret.rel)
```

**Arguments**

SD\_0 standard deviation of the non-clinical population

test.ret.rel test-retest reliability of the instrument

**Format**

numeric vector of values

## Details

This function computes value corresponding to "the minimum amount of change that could not be attributed to the error of measurement" (Biescad & Timulak, 2014, p. 150). If score change from before to post treatment is lower than value resulting from this function, than change in client score can be attributed to the effectiveness of the therapy but rather other factors such as a measurement error (Biescad & Timulak, 2014). This function is a result of modification of the original Jacobson and Truax (1991) formula by Wiger and Solberg (2001, p.148).

## Value

numeric vector

## Author(s)

Lukas Novak, <lukasjirinovak@gmail.com>

[clin\\_sig\\_chang\(\)](#) function for calculation of the clinical cut-off scores

## Examples

```
re.ch.in = RCI(SD_0 = 4.87, test.ret.rel = 0.66)
re.ch.in
```

---

two.g.comp

*Automatic two-groups comparison*

---

## Description

Automatic two-groups comparison

## Usage

```
two.g.comp(df, y, group.var)
```

## Arguments

df	data frame or tibble with one socio-demographic variable and one continuous variable
y	continuous variable
group.var	binary grouping variable

**Format**

An object of class "tibble"

**Details**

This function computes either Wilcox test or t-test depending on whether homogeneity of variances assumption is met or not.

**Value**

data frame

**Author(s)**

**References**

Myles Hollander and Douglas A. Wolfe (1973). Nonparametric Statistical Methods. New York: John Wiley & Sons. Pages 27–33 (one-sample), 68–75 (two-sample). Or second edition (1999).

**Examples**

```
# data loading
data(dat)
# running the function
two.g.comp.out.EC = two.g.comp(df = dat, y = "IRI_EC", group.var = "Gender")
# printing the output
print(two.g.comp.out.EC)
```

---

word2pdf

*word to pdf*

---

**Description**

Conversion of word document to pdf using either R Markdown package or Libre office. The latter represents higher quality approach - in general.

**Usage**

```
word2pdf(imp_file, out_file)
```

**Arguments**

imp_file	name of the word document to convert - without docx suffix
out_file	name of output pdf file without - without pdf suffix

**Format**

An object of class "pdf"

**Details**

this function is currently running only on windows

**Value**

pdf file

**Author(s)**

Lukas Novak, <lukasjirinovak@gmail.com>

**Examples**

```
# example from word do pdf
#word2pdf(imp_file = "example.docx",out_file = "example1.pdf")
```
