clin\_sig\_chang

Clinically significant change

# Description

**Index** 

This easy function calculates Clinically significant change (clinical cut-off scores) as defined by Jacobson and Truax (1991).

# Usage

```
clin_sig_chang(SD_0, SD_1, M_1, M_0)
```

# Arguments

SD_0	standard deviation of the non-clinical population
SD_1	standard deviation of the clinical population
M_1	mean of the clinical population
M_0	mean of the non-clinical population

# **Format**

numeric vector of values

## **Details**

This function computes cut-off score differentiating between the clinical and non-clinical population based on the Jacobson and Truax (1991) formula (p. 13). The mathematical formula can be also found in Biescad & Timulak(2014, p. 150).

# Value

numeric vector

# Author(s)

Lukas Novak, <lukasjirinovak@gmail.com>

RCI() function for calculation of the Reliable Change Index

## **Examples**

```
\label{eq:clin_cut.off} \begin{split} \text{clin.cut.off=clin\_sig\_chang(SD\_0 = 3.5,} \\ \text{SD\_1 = 2.1,} \\ \text{M\_0 = 4.2,} \\ \text{M\_1 = 12.1)} \\ \text{clin.cut.off} \end{split}
```

dat

IRI validation dataset

## **Description**

This dataset consists the two variables which were used in the study examining psychometric properties of the Interpersonal Reactivity Index.

# Usage

dat

#### **Format**

A data frame with 835 rows and 2 variables:

```
Gender integer COLUMN_DESCRIPTION

IRI_EC double COLUMN_DESCRIPTION
```

### **Details**

**DETAILS** 

4 lasy.log.reg

lasy.log.reg

Lasy logistic regression function

# Description

This function performs logistic regression and print results in tibble output. This function aims to provide the results of the regression analysis in the format, which is frequently desired in academic journals

# Usage

```
lasy.log.reg(
  independent.var,
  dependent.var,
  covariates,
  print.cov = FALSE,
  data
)
```

# Arguments

```
independent.var
```

independent variable/s

dependent.var dependent variable/s

covariates covariates to be included in a model

print.cov Print effect of covariates, default is FALSE

data frame or tibble object

## **Format**

```
An object of class "tibble"
```

## **Details**

Currently, this function does not provide model fit indicators such as AIC or BIC

#### Value

data frame

## Author(s)

                               covariates = c("Age"),
                               dependent.var = c("econom_stat_dich",
                                             "family_status",
                                             "edu_dich"),
                               data = "paq.validation.study")
print(regress.output)
```

mult.g.comp

Robust multi-group comparison

## **Description**

This function allows to compare multiple groups in multiple outcome variables with violated parametric assumptions.

## Usage

```
mult.g.comp(df, outcome.var, groups)
```

# **Arguments**

```
df data frame or tibble object outcome.var continuous variable/s groups grouping variable/s
```

6 mult.g.comp

#### **Format**

An object of class "tibble"

#### Details

Currently, this function does not use para

**DETAILS** 

RCI

Reliable Change Index (RCI)

# Description

This function calculates Reliable Change Index (RCI) as modified by Wiger and Solberg (2001, p.148).

#### Usage

```
RCI(SD_0, test.ret.rel)
```

RCI 9

#### **Arguments**

SD\_0 standard deviation of the non-clinical population test.ret.rel test-retest reliability of the instrument

#### **Format**

numeric vector of values

## **Details**

This function computes value corresponding to "the minimum amount of change that could not be attributed to the error of measurement" (Biescad & Timulak, 2014, p. 150). If score change from before to post treatment is lower that value resulting from this function, than change in client score can not be attributed to the effectiveness of the therapy but rather other factors such as a measurement error (Biescad & Timulak, 2014). This function is a result of modification of the original Jacobson and Truax (1991) formula by Wiger and Solberg (2001, p.148).

#### Value

numeric vector

10 two.g.comp

two.g.comp

Automatic two-groups comparison

## **Description**

Automatic two-groups comparison

## Usage

```
two.g.comp(df, y, group.var)
```

## **Arguments**

df data frame or tibble with one socio-demographic variable and one continuous

variable

y continuous variable

group.var binary grouping variable

#### **Format**

An object of class "tibble"

#### **Details**

This function computes either Wilcox test or t-test depending on whether homogeneity of variances assumption is met or not.

### Value

data frame

# data loading
data(dat)
# running the function
two.g.comp.out.EC = two.g.comp(df = dat, y = "IRI_EC", group.var = "Gender")
# printing the output
print(two.g.comp.out.EC)
```

word2pdf 11

word2pdf word to pdf

# **Description**

Conversion of word document to pdf using either R Markdown package or Libre office. The latter represents higher quality approach - in general.

# Usage

```
word2pdf(imp_file, out_file)
```

# Arguments

#### **Format**

An object of class "pdf"

#### **Details**

this function is currently running only on windows

# Value

pdf file

# Author(s)
